Acknowledgement	i
Abstract	ii
Publication List	vi
1 Introduction	1
1.1 Reservoir computing	1
1.2 Quantum information scrambling	10
1.3 Quantum phase transitions	22
1.4 Purpose of this thesis	29
2 Harnessing magnetic materials for thermally-robust spatiotem- poral parallel computation	30
2.1 Setup	31
2.2 Methods	34
2.2.1 LLG calculation	34
2.2.2 Scheme for training and testing	34
2.3 Results	35
2.3.1 Thermal robustness through frequency domain filtering . .	35
2.3.2 Memory capacity task	41
2.3.3 Echo state property with frequency filtering	42
2.3.4 Parallel reservoir computing in frequency and spatial domains	43
2.3.5 Logic gate operation of bits in different threads	47
2.3.6 Video recognition based on vast parallelization	52
2.4 Discussion	55
3 Harnessing quantum processors for predicting quantum signals	58
3.1 Setup	61
3.2 Results	63
3.2.1 Short term memory capacity	63
3.2.2 Implementations with unitary Hamiltonian dynamics	66

3.2.3	Integration of multiple feedback connections	68
3.2.4	Effects of the statistical uncertainty arising from a limited number of measurements	71
3.2.5	Predictive performance for dynamics of classical and quan- tum systems	72
3.3	Discussion	79
4	Probing quantum information scrambling	80
4.1	Framework of the QRP	81
4.1.1	Setup	81
4.1.2	Methods	83
4.2	Results	85
4.2.1	Dynamics of information propagation	85
4.2.2	Information distribution in the Hilbert space	88
4.2.3	Comparison with the OTOC and TMI	89
4.2.4	Sensitivity of the QRP	92
4.3	Discussion	93
5	Probing quantum phase transitions	96
5.1	Framework of the QRP for pure states	98
5.1.1	Setup	98
5.1.2	Methods	101
5.2	Results	103
5.2.1	Transverse-field Ising model	103
5.2.2	Anisotropic next-nearest-neighbor Ising model	107
5.2.3	Spin-1 XXZ Heisenberg model	108
5.3	Discussion	111
6	Summary	114
	Bibliography	118
A	Information stored in various degrees of freedom	135
B	Average of the recovery performance over various subsets of spa- tiotemporal indices	138
